Stratus Mobile Firewall

Stratus Mobile ensures HIPAA compliance in any environment. From at-home care, to associated clinics, to mobile transport, Stratus interpreters can be reached quickly and securely. Stratus Mobile uses SSL AES 256 encryption from the client to the core. You only need to open ports outbound from your secure network to two IP Addresses represented by the DNS name lb.edge.stratusvideo.com. This limits the exposure of possible attacks when using the Stratus Mobile product.

Here's how to set it up:

Stratus Mobile requires two outgoing ports

https (tcp 443) and turn (udp 3478)

to be opened to:

LB.Edge.Stratusvideo.com

74.119.12.142

74.119.14.142

Please disable web proxy to 74.119.12.142 and 74.119.14.142.

DNS name lb.edge.stratusvideo.com as web proxy servers can cause issues with SSL traffic.

All calls will initiate from the client outbound via an SSL proxy to our secure core Data Centers and into our secure MPLS network, making your connection efficient and safe.
